What are Cellulose Swabs?

They are perforated sheets made from highly bleached cellulose. Cellulose is a polysaccharide consisting of chains of glucose monomers, these chains are a natural polymer which hold fibers together.

What are they used for?

- External wound dressing
- Cleaning the skin before injections
- Absorbent padding for small injuries
- Bandage for after testing
- Promote/support blood coagulation
- Minimize presence of blood

Why use them?

They absorb wound discharge and resemble the body’s natural collagen. Collagen is synthesized by the body to provide structure and strength by forming a scaffold.

This product was initially developed as an aid to Hep C prevention.
